

POLYTAN ACS 210 – MAINTENANCE UNIT FOR SYNTHETIC TURF SYSTEMS

When it comes to regular care and maintenance of optimum technical and sports physiology factors, Polytan recommends the Polytan ACS unit to its customers which is used for brushing the synthetic turf and for levelling and loosening the infill.

BENEFITS

- Perfectly suited to Polytan synthetic turf systems
- Individually adjustable brushes and needle bars
- Simple operation and functionality
- Cost-effective maintenance unit

POLYTAN ACS 210 – MAINTENANCE UNIT FOR SYNTHETIC TURF SYSTEMS

The Polytan ACS maintenance unit has been specially constructed and tested for use on football turf systems. It is fitted as standard on the rear hydraulics of a turf tractor. As a result, the add-on device can be raised when turning and outside of the areas to be treated. It can also be fitted with a tow bar on the towing device.

The Polytan ACS unit has two working elements (brushes and needle bars) that can be used either separately or in combination. In one pass, the synthetic turf filaments can be brushed and the rubber granules loosened and levelled. Brushing the filaments re-optimises ball rolling and playing properties. Loosening and levelling the infill granules ensures improved player protection and excellent drainage properties. Regular care and maintenance permanently preserves the naturalistic look of the synthetic turf system.

We offer a variety of wet and dry cleaning services performed by our qualified experts for an intensive deep clean on all synthetic turf systems.
